Lab 1 - Requirements Table: Virtual Technical Conference Platform

Problem Description: A technical symposium portal that manages double-blind paper reviews, generates conflict-free multi-track presentation schedules, and provides real-time upvoted Q&A queues during live sessions. Key stakeholders include Conference Authors and Track Chairs.

Req ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall anonymize submitted manuscripts (strip author headers and metadata) before assigning them to reviewer pools for double-blind review.	High	Pass: Reviewer sees anonymized paper. Fail: Author identity visible to peer reviewer.	Given in problem statement. Preserves double-blind review integrity from the moment of submission.
FR-002	Functional	The system shall allow a Track Chair to assign each submitted paper to at least two reviewers who have no conflict of interest (same institution or prior co-authorship).	High	When a Track Chair attempts to assign a reviewer flagged as a conflict of interest, the system blocks the assignment and displays a warning message.	Prevents biased or invalid reviews and protects the credibility of the review process.
FR-003	Functional	The system shall generate a multi-track presentation schedule that assigns each accepted paper to a session slot without room or speaker double-booking.	High	Running the scheduler on a test set of 50 accepted papers produces zero room or speaker conflicts, verified by an automated conflict checker.	Core scheduling functionality; prevents logistical failures such as two sessions competing for the same room or speaker.
FR-004	Functional	The system shall allow attendees to submit questions during a live session and display them in a queue ordered by descending upvote count.	Medium	When an attendee upvotes a question, its position in the queue updates within 2 seconds and the list re-sorts in descending vote order.	Enables real-time audience engagement and surfaces the most relevant questions to the speaker first.
FR-005	Functional	The system shall allow reviewers to submit scores and comments for an assigned paper without displaying the author's identity anywhere on the review form.	High	When a reviewer opens the review form, author name and affiliation fields are absent; the submitted review is stored with only reviewer ID and paper ID.	Maintains double-blind integrity through the entire review lifecycle, not just at submission.
NFR-001	Nonfunctional (Performance & Security)	The multi-track schedule generator shall resolve session room capacities and speaker availability constraints in under 10 seconds.	High	Pass: Benchmarking tests confirm target latency and security standards under simulated peak load.	Given in problem statement. Track Chairs need near-instant feedback while adjusting a live schedule.
NFR-002	Nonfunctional (Security)	The system shall restrict access to author identity data using role-based access control, so that only Track Chairs (not Reviewers or Attendees) can view unmasked submissions.	High	A simulated access attempt to author metadata using Reviewer or Attendee credentials returns access denied in 100% of test attempts.	Protects double-blind review integrity and stakeholder privacy; a single leak would undermine the whole review process.
